CLAIMS

- 1. A cationic dye compound for detecting a double stranded nucleic acid, comprising:
- a cation group and a chromophore coupled to said cation group, wherein said chromophore has a heteropolycyclic structure containing a nitrogen atom and said cation group is capable of binding to a double stranded nucleic acid.
- 2. The cationic dye compound according to claim 1, wherein 10 saidcationic dye compound is represented by the following general formula (I):

$$X-(Y-Z)_{n} \tag{I}$$

5

where n denotes 1 to 12, X represents a choromophore having at least four pyrrole rings, Y represents a connecting group or a direct bond between X and Z, and Z represents a cationic functional group, or a functional group whose property is convertible to a cationic property.

- 3. The cationic dye compound according to claim 1 or 2, wherein 20 said choromophore is selected from the group consisting of porphyrin, porphyrin derivatives, phthalocyanine, and phthalocyanine derivatives.
- 4. A method for detecting a hybrid nucleic acid by use of a cationic dye compound, comprising:

providing a cationic dye compound comprising a cation group and a chromophore coupled to said cation group, said

chromophore having a heteropolycyclic structure containing a nitrogen atom;

bringing a nucleic acid probe and a sample containing a target nucleic acid into contact with each other under hybridization conditions to form a hybrid nucleic acid composed of said nucleic acid probe and said target nucleic acid;

binding said cationic dye compound onto said hybrid nucleic acid by adding the cationic dye compound before, during or after said hybridization; and

- 10 measuring spectroscopic properties of said cationic dye compound bound onto said hybrid nucleic acid.
- 5. The method according to claim 4, wherein said cationic dye compound is represented by the following general formula
 15 (I):

$$X - (Y - Z)_n \tag{I}$$

5

20

25

where n denotes 1 to 12, X represents a choromophore having at least four pyrrole rings, Y represents a connecting group or a direct bond between X and Z, and Z represents a cationic functional group, or a functional group whose property is convertible to a cationic property.

- 6. The method according to claim 4, wherein said choromophore is selected from the group consisting of porphyrin, porphyrin derivatives, phthalocyanine, and phthalocyanine derivatives.
- 7. The method according to claim 4, further comprising:

immobilizing an analyte having said target nucleic acid or said nucleic acidprobe onto a solid phase carrier to bring said analyte and said nucleic acid probe into contact with each other under hybridization conditions.

5

10

15

8. An apparatus for detecting a hybrid nucleic acid by use of a cationic dye compound, comprising:

means for bringing a nucleic acid probe and a sample containing a target nucleic acid into contact with each other under hybridization conditions to form a hybrid nucleic acid composed of said nucleic acid probe and said target nucleic acid;

means for binding said cationic dye compound onto said hybrid nucleic acid by adding the cationic dye compound before, during or after said hybridization, wherein said cationic dye compound comprises a cation group and a chromophore coupled to said cation group, said chromophore having a heteropolycyclic structure containing a nitrogen atom; and

means for measuring spectroscopic properties of said cationic dye compound bound onto said hybrid nucleic acid.
